

GBIS Wireless Broadband Solutions

Broadband Wireless Access (BWA) has emerged as an exceptional last-mile access alternative to DSL and Cable Modems. A BWA system offers carriers total independence from land line infrastructure's limited reach while providing heightened bandwidth flexibility and service differentiation.

<p>DEPLOYMENT</p> <p>Outdoor Wireless LAN solutions are deployed in a point-to-multi-point architecture, with one site being the hub and the remainder acting as remote sites. At the hub one or more outdoor wireless LAN access points (also known as base units) are installed. The antennas of these units must be aligned to provide radio coverage to all of the remote sites. The access point is connected via a standard Ethernet interface to the enterprise LAN at the hub site. At each remote site a specialized outdoor wireless LAN station adaptor (also known as remote bridge) is installed. The remote bridge is connected to the remote building's LAN via a standard Ethernet interface providing high-speed connectivity to the hub site and all other connected sites.</p>	<p>BENEFITS</p> <p>Using GBIS outdoor wireless solutions, your business gains the following benefits:</p> <ul style="list-style-type: none"> • High speed LAN connection between buildings or to the Internet • No recurring leased-line charges • No expensive and inconvenient digging required • Quick deployment: Connection can be up and running in hours • No need for radio license (in most countries) • Secure connection with RC4 Wired Equivalent Privacy
